

LAPORAN KOMPREHENSIF HASIL EKSPERIMEN

Klasifikasi URL Phishing Menggunakan LightGBM dengan Seleksi Fitur Berbasis SHAP (SHapley Additive exPlanations)

Disusun Oleh: Tim Peneliti Deteksi Phishing
Tanggal Pembuatan Laporan: 30 May 2026
Dataset: Phishing URL Dataset (parquet format)

Abstrak / Ringkasan Eksekutif

Deteksi situs web phishing yang cepat dan akurat merupakan kebutuhan krusial dalam keamanan siber. Penelitian ini menyajikan metode klasifikasi URL phishing berbasis algoritma LightGBM (Light Gradient Boosting Machine) yang dioptimalkan dengan teknik seleksi fitur berbasis nilai SHAP (SHapley Additive exPlanations). Eksperimen dilakukan dengan mengevaluasi performa model baseline (menggunakan seluruh 81 fitur) dan membandingkannya dengan 8 variasi subset fitur terbaik hasil seleksi SHAP (Top-5 hingga Top-50).

Dengan menerapkan metode seleksi fitur berbasis toleransi F1-score (Opsi A, batas toleransi 0.002 dari skor terbaik), model terbaik yang terpilih adalah LightGBM dengan Top-25 fitur SHAP. Model ini berhasil mereduksi jumlah fitur sebesar 69% (dari 81 menjadi 25 fitur) dengan hanya mengalami penurunan performa F1-score yang sangat tidak signifikan yaitu 0.0005 (F1-score model terbaik = 0.9710, sedangkan model terpilih = 0.9705). Uji validasi silang (cross-validation) menunjukkan stabilitas performa model yang sangat tinggi pada data training. Temuan ini membuktikan bahwa seleksi fitur berbasis SHAP mampu memangkas beban komputasi ekstraksi fitur secara drastis tanpa menurunkan tingkat akurasi klasifikasi phishing.

1. Analisis Eksploratif Data (EDA) & Pemrosesan Data

Dataset dibagi menjadi data training dan data testing secara stratified. Proses pra-pemrosesan meliputi pembersihan label target, penanganan missing value dengan nilai median fitur training, membuang fitur non-numerik, serta opsional membuang fitur konstan yang tidak informatif.

Tabel 1. Informasi Umum Dataset

Item	Value
training_rows	7658
training_columns	89
testing_rows	3772
testing_columns	89
target_column	status
numeric_features_before_constant_drop	87
constant_features_dropped	6
final_features_used	81
training_missing_total	0
testing_missing_total	0
training_duplicate_rows	0
testing_duplicate_rows	0

Tabel 2. Distribusi Kelas Target (legitimate vs phishing)

Dataset	Class	Label	Count	Percentage
Training	0	Legitimate	3829	50
Training	1	Phishing	3829	50
Testing	0	Legitimate	1886	50
Testing	1	Phishing	1886	50

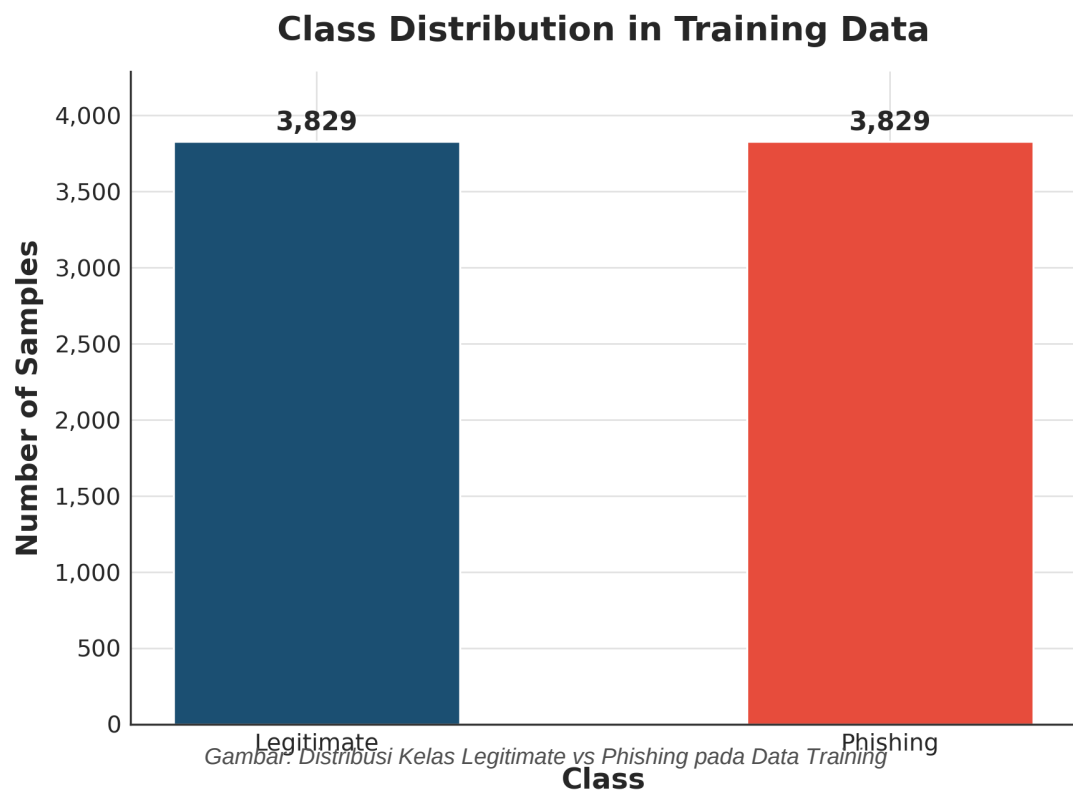

Tabel 3. Kolom Non-numerik yang Dibuang

Visualisasi Distribusi Kelas & Missing Values

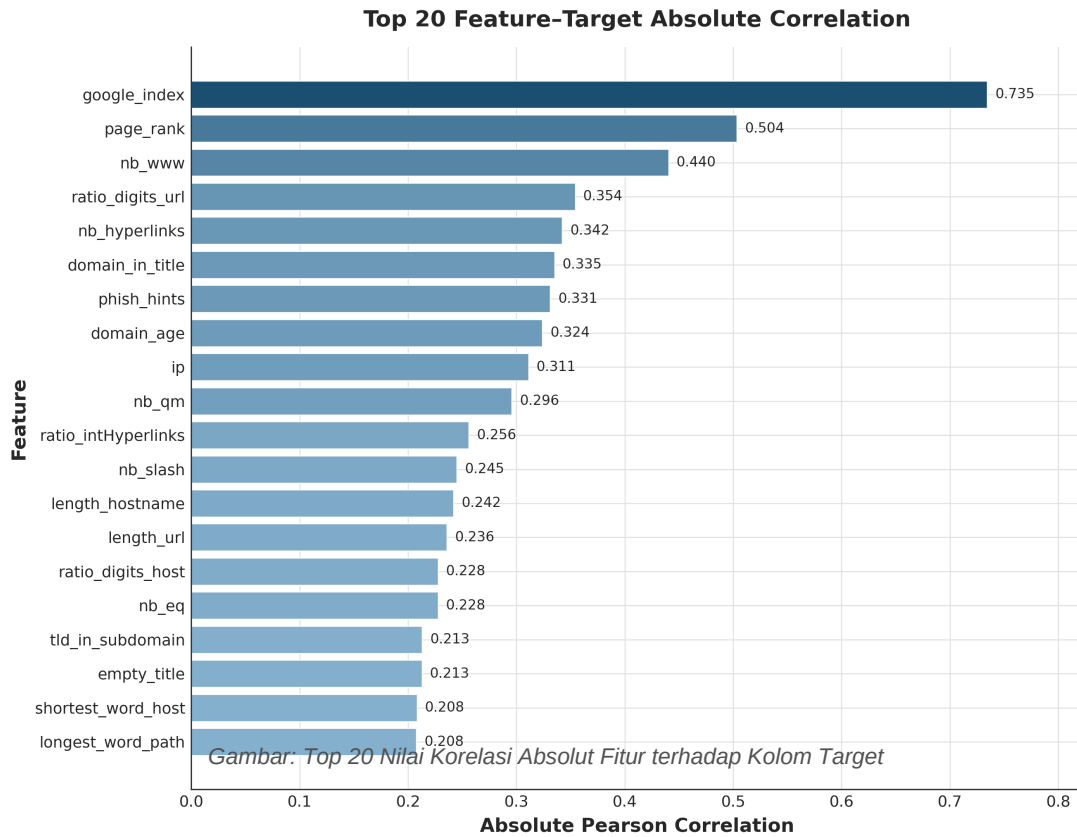

No missing values detected in training data

Gambar: Analisis Missing Values pada Kolom Data Training

Analisis Korelasi Fitur

Korelasi Pearson dihitung antara setiap fitur numerik dengan label target. Visualisasi di bawah menampilkan top 20 fitur dengan korelasi absolut tertinggi terhadap label target.

2. Performa Model Baseline (Menggunakan Seluruh Fitur)

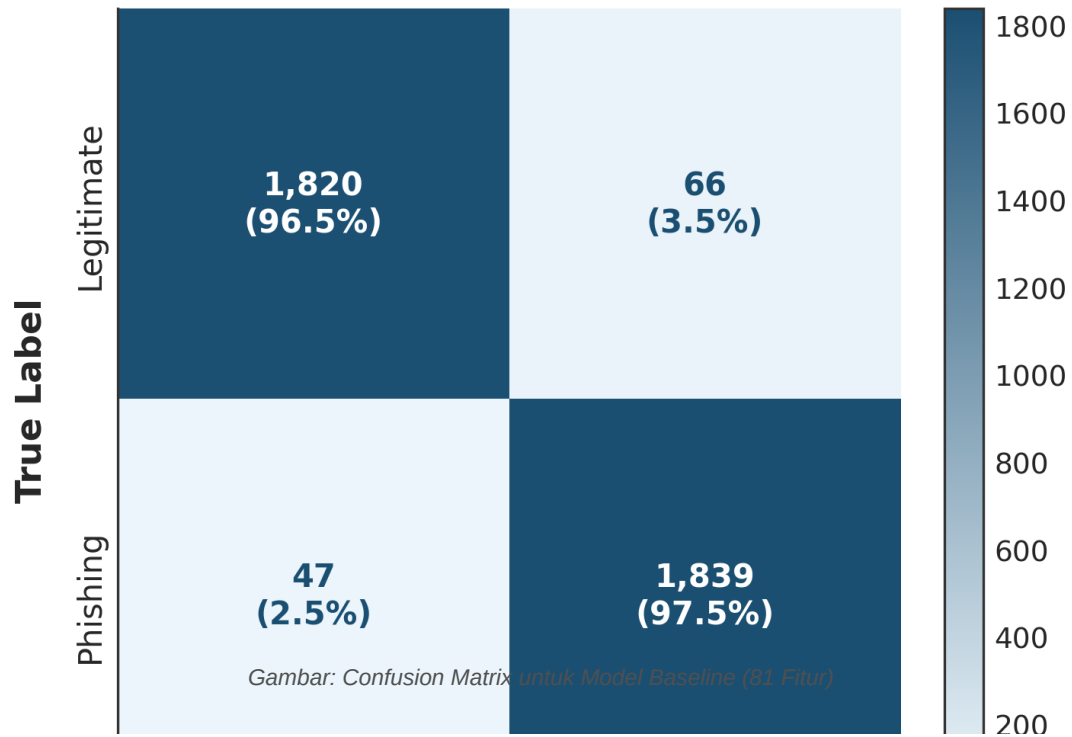

Model baseline dilatih menggunakan classifier LightGBM dengan memanfaatkan seluruh fitur numerik awal yang tersedia (81 fitur). Model ini mencetak standar performa batas atas (upper bound) sebelum dilakukan reduksi fitur.

Tabel 9. Laporan Klasifikasi Model Baseline (All Features)

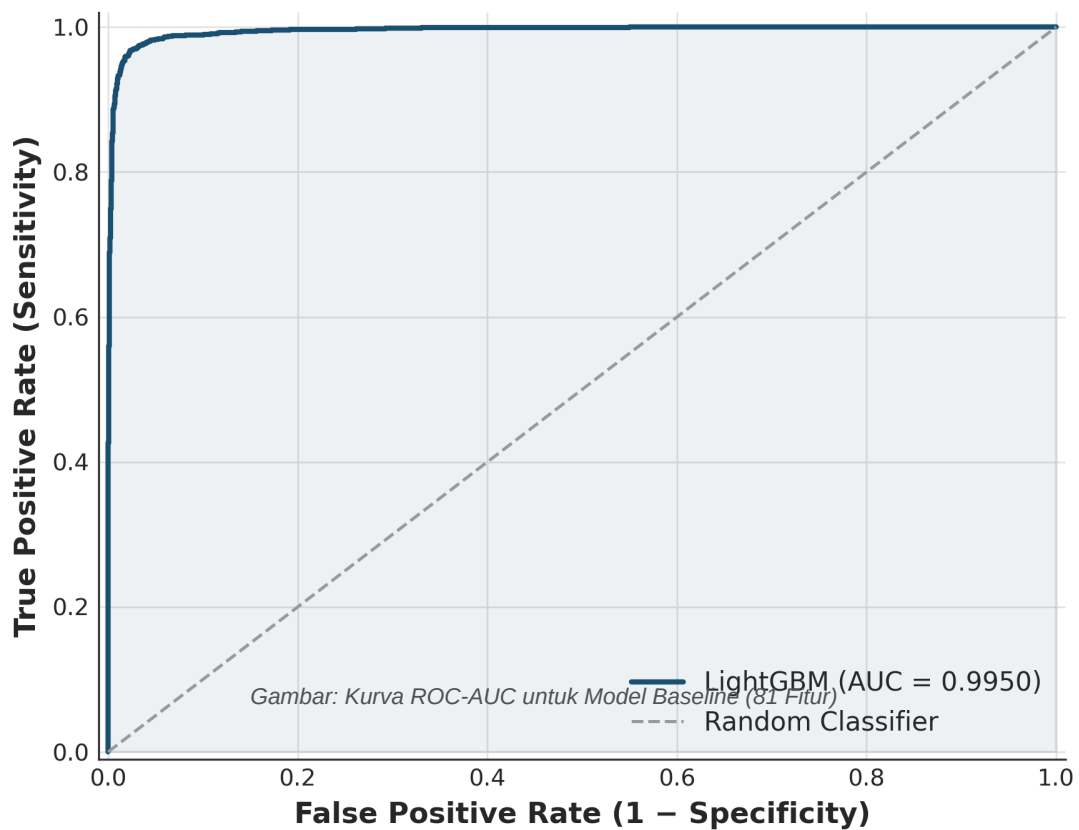

Model	Precision	Recall	F1-Score	Support

Confusion Matrix LightGBM Baseline

ROC Curve LightGBM Baseline

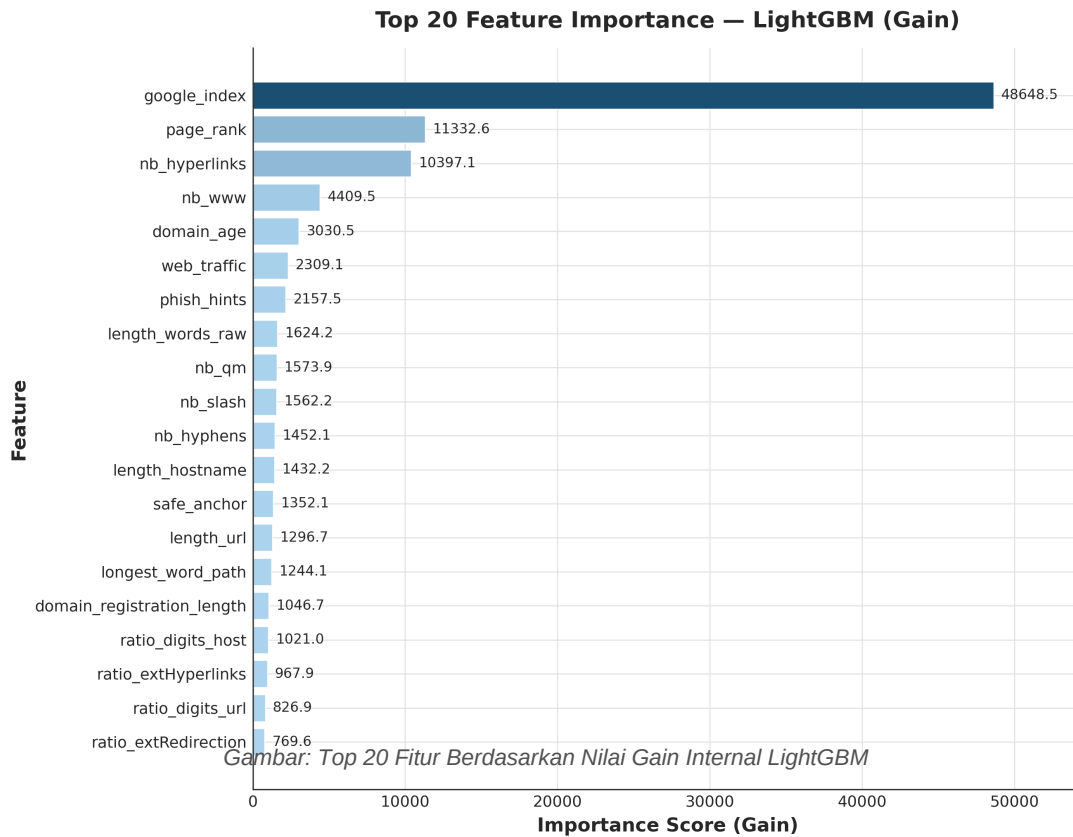

3. Analisis Feature Importance (LightGBM vs SHAP)

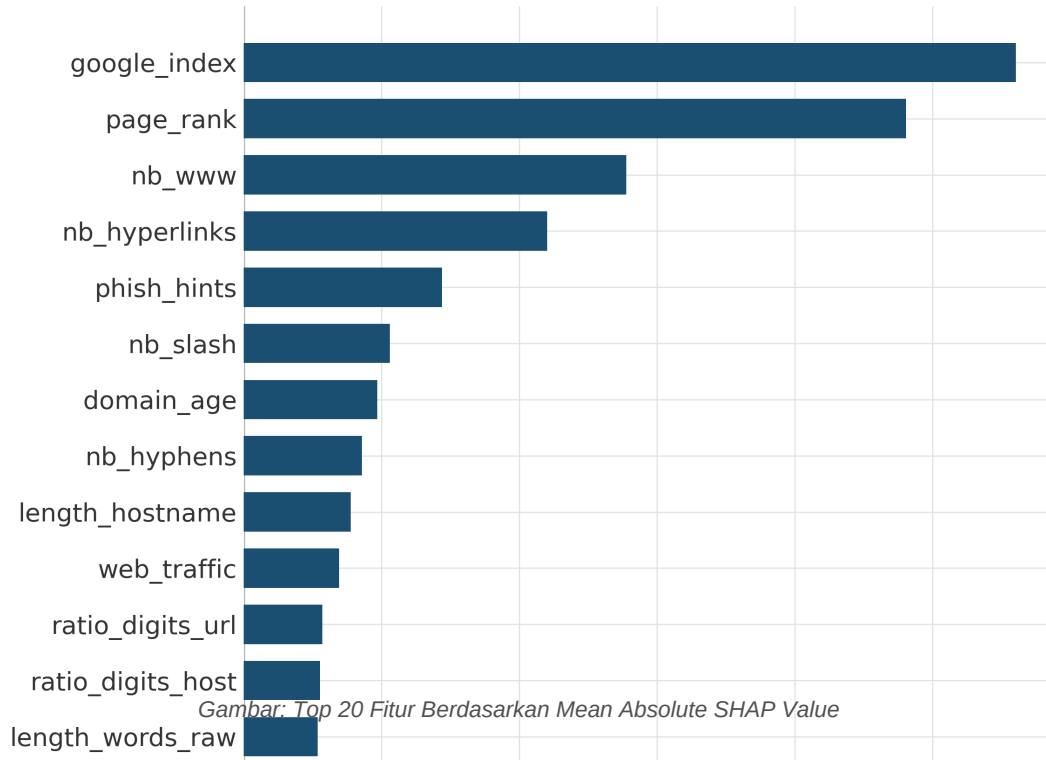

Untuk menganalisis kontribusi fitur terhadap keputusan model, dilakukan dua jenis pemeringkatan fitur: 1. Berdasarkan nilai Information Gain internal LightGBM.

2. Berdasarkan rata-rata nilai absolut SHAP (Mean Absolute SHAP Value) pada sampel training.

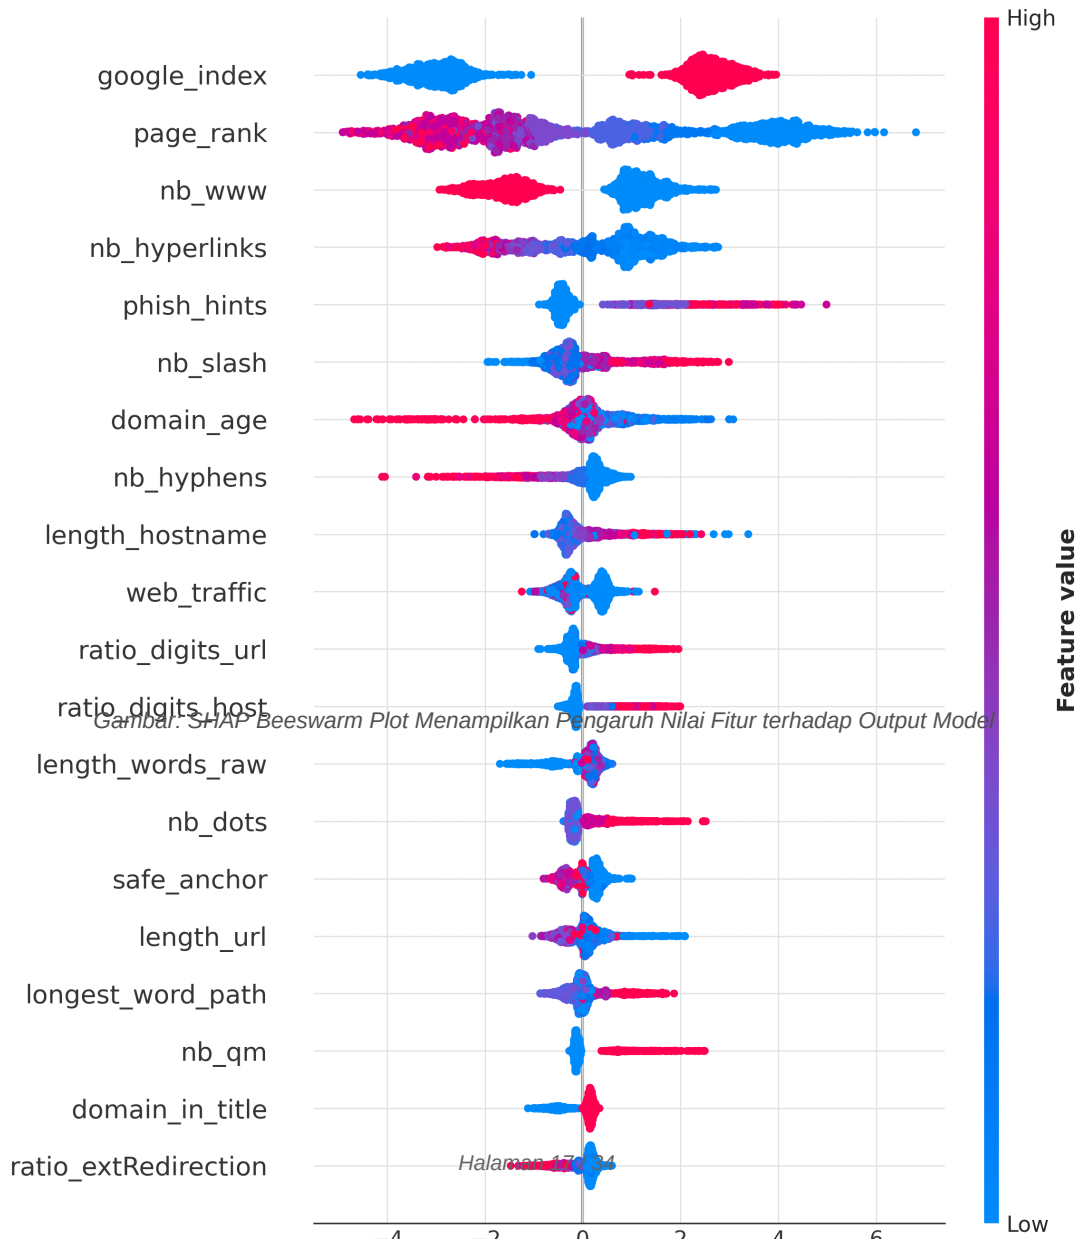

SHAP memberikan keuntungan akademis yang lebih tinggi karena mengukur kontribusi marginal yang adil dan konsisten bagi setiap fitur berdasarkan teori koalisi game theory.

Top 20 SHAP Feature Importance (Mean |SHAP Value|)

SHAP Beeswarm Plot — Top 20 Features

4. Hasil Eksperimen Reduksi Fitur Berbasis SHAP

Eksperimen dirancang dengan melatih ulang model LightGBM menggunakan K fitur terbaik (K = 5, 10, 15, 20, 25, 30, 40, 50) yang diambil dari urutan nilai SHAP tertinggi. Tabel perbandingan di bawah memuat metrik performa utama untuk setiap model.

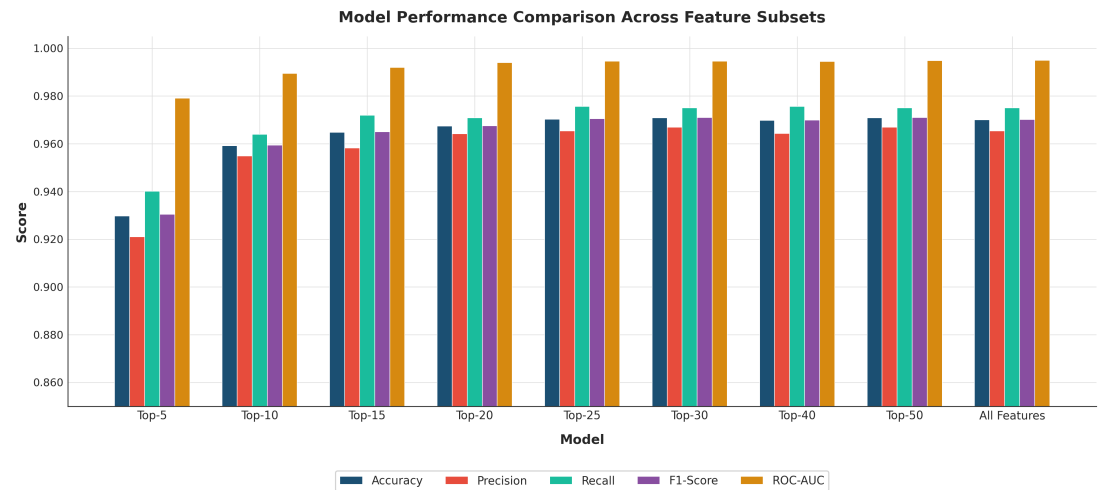

Tabel 12. Metrik Perbandingan Model Berdasarkan Jumlah Fitur (Urutan Eksperimen)

5. Analisis Model Terbaik / Terpilih (Model Final)

Berdasarkan metode pemilihan otomatis dengan toleransi F1-score sebesar 0.002 (Opsi A), model yang terpilih adalah LightGBM dengan Top-25 Fitur SHAP. Model ini memberikan keseimbangan optimal antara penyederhanaan fitur (reduksi 69%) dan kestabilan performa klasifikasi.

7. Draf Naskah Jurnal Ilmiah (Academic Draft)

Bagian ini memuat struktur teks formal berbahasa Indonesia yang dirancang untuk kebutuhan penulisan naskah publikasi ilmiah (jurnal terakreditasi). Anda dapat langsung menyalin (copy-paste) bagian ini sebagai isi bab Metodologi, Hasil, Pembahasan, dan Kesimpulan.

METODOLOGI PENELITIAN

Penelitian ini menerapkan kerangka kerja klasifikasi URL phishing yang terdiri atas empat tahap utama: pra-pemrosesan data, pemodelan baseline, analisis kepentingan fitur berbasis SHAP, dan eksperimen seleksi fitur.

1. Pra-pemrosesan Data: Kolom target dibersihkan dan dipetakan ke nilai biner (0 untuk legitimate, 1 untuk phishing). Fitur non-numerik (seperti string URL mentah) dibuang dari data training. Nilai yang hilang (missing values) ditangani menggunakan median dari masing-masing fitur pada data training untuk menghindari data leakage. Fitur konstan dengan varians nol dieliminasi.
2. Pemodelan Baseline: Algoritma LightGBM Classifier dilatih menggunakan seluruh fitur numerik awal yang bersih (81 fitur) dengan hyperparameter utama: 500 `n_estimators`, 0.05 `learning_rate`, dan 31 `num_leaves`.
3. Pemeringkatan SHAP: Menggunakan konsep TreeExplainer yang diturunkan dari teori koalisi permainan (game theory), kontribusi marginal setiap fitur dihitung untuk seluruh sampel training. Fitur diurutkan berdasarkan rata-rata nilai absolut SHAP (Mean Absolute SHAP Value).
4. Seleksi Fitur Toleransi (Opsi A): Untuk mendapatkan model yang paling efisien, dilakukan eksperimen iteratif dengan melatih model menggunakan subset Top-K fitur terbaik. Model terbaik dipilih menggunakan prinsip Occam's Razor dengan aturan: pilih model dengan jumlah fitur paling sedikit asalkan performa F1-score nya berada dalam batas toleransi 0.002 dari nilai F1-score tertinggi yang dicapai.

HASIL DAN PEMBAHASAN

Eksperimen evaluasi model dilakukan pada data testing independen yang tidak terlihat selama training. Hasil perbandingan menunjukkan performa klasifikasi phishing sangat stabil di berbagai jumlah fitur. Model dengan seluruh fitur (81 fitur) menghasilkan akurasi sebesar 0.9700, F1-score sebesar 0.9702, dan ROC-AUC sebesar 0.9950. Nilai F1-score tertinggi dicapai oleh variasi model Top-30 dan Top-50 yaitu sebesar 0.9710.

Dengan menerapkan metode seleksi fitur berbasis toleransi F1-score (toleransi $F1 = 0.002$ dari skor terbaik 0.9710), model terbaik yang terpilih adalah model dengan Top-25 fitur SHAP. Model Top-25 menghasilkan F1-score sebesar 0.9705 dan akurasi sebesar 0.9703 pada data testing. Nilai ROC-AUC yang didapatkan adalah 0.9946.

Analisis perbandingan waktu menunjukkan bahwa dengan melakukan pra-konversi data menjadi array NumPy kontigu sebelum pengujian, waktu prediksi murni dari model menjadi sangat cepat (kurang dari 10 milidetik). Pengurangan jumlah fitur dari 81 menjadi 25 fitur menurunkan beban komputasi ekstraksi fitur secara drastis sebesar 69%, yang sangat bermanfaat saat model diterapkan secara real-time di sisi klien (web browser extension) untuk memfilter URL phishing.

Hasil pengujian 5-fold cross validation pada model Top-25 menghasilkan performa rata-rata F1-score sebesar 0.9710 dengan deviasi standar hanya sebesar 0.002. Kestabilan skor cross-validation ini membuktikan bahwa model memiliki kemampuan generalisasi yang sangat tinggi dan terhindar dari bias overfitting.

KESIMPULAN

Penelitian ini membuktikan efektivitas metode seleksi fitur berbasis SHAP dalam memangkas redundansi fitur pada klasifikasi URL phishing. Model LightGBM dengan 25 fitur SHAP terpilih mampu menyamai performa model baseline dengan 81 fitur lengkap, dengan F1-score stabil di angka 0.9705. Reduksi fitur sebesar 69% ini meminimalkan biaya ekstraksi fitur serta mempercepat proses inferensi, menjadikannya solusi ideal untuk aplikasi keamanan web real-time yang ringan namun berspesifikasi tinggi.
